#### QAPP Worksheet #2 QAPP Identifying Information

| Site Name/Project Name: Activity-Based Outdoor Air Exposures, OU 8, Libby Asbestos Superfund Site                         |
|---|
| Site Location: Libby, Montana   |
| Site Number/Code: 08BC  |
| Operable Unit: OU8  |
| Contractor Names: TechLaw, Inc.   |
| Lockheed Martin   |
| Contractor Number: EP-W-06-033 (TechLaw, Inc.) EP-W-09-031 (Lockheed Martin)  |
| Contract Title: ESAT (TechLaw, Inc.)  |
| SERAS (Lockheed Martin)   |
|   |
| Work Assignment Number: MM-102 (ESAT)   |
| SER00084 (SERAS)  |
| 1. Identify regulatory program: <u>Comprehensive Environmental Response, Compensation, Liability Act of 1980 (CERCLA)</u> |
| 2. Identify approval entity: <u>ERT and EPA Region VIII</u>   |
| 3. The QAPP is (select one): ☐Generic ☐Project Specific   |
| 4. List dates of scoping sessions that were held: <u>04/23/2010</u>   |
| 5. List dates and titles of QAPP documents written for previous site work, if applicable:                                 |
| Title Approval Date   |
|   |
|   |
|   |
|   |
|   |
|   |
| 6. List organizational partners (stakeholders) and connection with lead organization:                                     |
| ERT   |

Montana Department of Environmental Quality (MDEQ) 7. List data users:

**EPA Region VIII** 

Montana Department of Transportation (MDOT)

**MDEQ** 

**MDOT** 

8. If any required QAPP elements and required information are not applicable to the project, provide an explanation for their exclusions below:

Worksheet #25 - Responsibility of the EPA Region VIII Contrated Laboratory (ESAT or subcontract laboratory determined by ESAT), Worksheet #28 – Information provided in Worksheet #12, Worksheet #37 - Responsibility of EPA Region VIII

Comments: The MDOT rotomilling and asphalt work on both sidewalks and roadways along Highway 37 between Highway 2 and the bridge over the Kootenai River in Libby, Montana is scheduled to begin in July 2010. This OAPP will be used to support an activity based sampling (ABS) and monitoring effort that will run in conjunction with the MDOT rotomilling work. This QAPP describes the collection of data needed to characterize exposures of site workers and Libby residents to asbestos during the rotomilling activities. In addition to the rotomilling work, MDOT is concerned about potential asbestos contamination along several miles of roadways in OU8. The roadways include Highway 37 between Rainy Creek Road and the dam, Highway 2, and secondary Highways 260, 482, and 567. This QAPP will be used to support soil sample collection along the five highway segments, followed by ABS sampling, in order to characterize the level of asbestos contamination in these areas. Soil sample collection is scheduled to begin July 20, 2010 prior to the rotomilling work. This document contains all the elements required for the SAP/QAPP and was developed in accordance with the Uniform Federal Policy for Quality Assurance Project Plans (EPA-505-B-04-900A).

Action Items: Participants of this project scoping session discussed and clarified the following: objectives and scope of the fieldwork; equipment and training needs; field operating procedures, schedules of events, and individual assignments; required QA/QC measures; health and safety requirements; documents governing fieldwork that must be on-site; and any changes in the field planning documents. ESAT

Title: Libby OU8 SAP/QAPP Revision Number: Final Revision Date: 11/07/2011 Page 14 of 52

## QAPP Worksheet #9 Project Scoping Session Participants Sheet (continued)

incorporated all additional information and decisions made during this scoping session into the Final SAP/QAPP.

Consensus Decisions for the Highway Segment Work: A member of the field crew will be used to visually spot vermiculite along the highway segments. Composite soil samples will be collected from areas with the highest concentration of visible vermiculite. The number of aliquots that will make up one composite sample and the number of composite samples to be collected was determined. The exact locations of ABS sampling will be determined in the field based on the results of the composite soil samples. ABS samples will also be collected from lawn mowing equipment while MDEQ mows along Highway 37.

Consensus Decisions for the Rotomilling Work: The number of low and high volume perimeter air samples to be collected was determined. The number of collection stations for ambient air samples was determined; however, the exact locations of the collection stations will be determined in the field. Additional samples may be collected based on the duration of the rotomilling activities and the amount of time unpaved road surfaces will be exposed.

Revision Number: Final
Revision Date: 11/07/2011
Page 15 of 52

#### QAPP Worksheet #10 Problem Definition

The problem to be addressed by the project: As determined by previous investigations conducted at the Libby Asbestos Superfund Site, Libby Amphibole asbestos (LA) is present in multiple environmental media in Libby (indoor and outdoor air, vermiculite insulation, and soils). MDOT is concerned about the level of asbestos contamination in outdoor air, if any, encountered during routine maintenance activities along highway Right of Ways (ROWs). Maintenance activities may include lawn mowing, road sweeping, ditch cleaning, and brush cutting. During 2006 and 2007, Tetra Tech, Inc. collected soil and air samples during routine maintenance activities, and LA was detected in some of these samples. In March 2010, ESAT personnel analyzed five asphalt core samples for asbestos by polarized light microscopy (PLM). These core samples were taken from California Street and Highway 2 in Libby. In one of the core samples, trace (0.1%) LA was detected indicating that LA may also be embedded in the roads in and around Libby. MDOT will begin conducting rotomilling and asphalt work in July 2010. The airborne dust generated from these road construction activities, as well as routine maintenance activities, may potentially be contaminated with LA; therefore, persons performing the rotomilling and maintenance work and the residents of Libby may be exposed to LA, which may pose a risk of cancer and/or non-cancer effects. Note that other amphibole asbestos and chrysotile asbestos may also be encountered during the analysis of air samples, which is most likely the result of the brake lines used in commercial trucks.

ERT/SERAS personnel will be conducting all data monitoring and sampling activities. ERT will provide persons who are trained to visibly detect vermiculite in soils. SERAS personnel will collect soil aliquot samples at locations based on the results of the visible vermiculite detection; the soil aliquots will be used to create composite samples. The exact location (latitude and longitude data) of each soil aliquot collected will be recorded on-site using a global positioning system (GPS) unit. ABS samples will be collected along the five highway segments based on the results of the soil samples. Air samplers will be placed on mowers while MDEQ mows the ROWs along Highway 37. SERAS personnel will set up DataRAMs for real-time data collection and monitoring of airborne dust emissions during rotomilling activities. Meteorological (MET) data (ambient temperature, relative humidity, wind speed and direction, and station pressure readings) will be collected by SERAS personnel using a portable 3-meter tower, and data will be stored in 5-minute averages. Perimeter samplers will be set up both upwind and downwind of the rotomilling activities, as well as an ABS sample on the rotomilling equipment. The exact locations of the perimeter air samplers will be determined in the field on the day of the sample collection, and will be based on MET data and traffic patterns. Exact locations of perimeter air samples will be recorded on-site using a GPS unit. Ambient air samplers will be set up at locations along Highway 37 during the entire duration of the rotomilling activities and while unpaved and/or unfinished sidewalk and road surfaces are exposed. The exact locations of the ambient air samplers will be recorded on-site using a GPS unit. All soil and air samples will be analyzed for asbestos by ESAT, or a subcontract laboratory determined by ESAT, on a rapid turn-around time.

The environmental questions being asked: Is dust contaminated with LA being generated during routine maintenance activities along highway ROWs? The rotomiller sprays water over the immediate area while it is in operation; however, as the back end dries and sidewalks and roads are not yet resurfaced, is there a need for additional dust suppression? Are rotomilling activities impacting ambient air quality? Note that MDOT is responsible for clean-up of any dust generated from the rotomilling activities.

Observations from any site reconnaissance reports: N/A

Title: Libby OU8 SAP/QAPP Revision Number: Final Revision Date: 11/07/2011 Page 16 of 52

### QAPP Worksheet #10 Problem Definition (continued)

A synopsis of secondary data or information from site reports: The analytical results of the soil and air samples collected by Tetra Tech, Inc. in 2006 and 2007 indicate that routine maintenance activities along highway ROWs could generate dust that is potentially contaminated with LA. The analytical results from the March 2010 asphalt core sample study indicate that the MDOT rotomilling and asphalt work could also generate dust that is potentially contaminated with LA.

The possible classes of contaminants and the affected matrices: Asbestos contamination impacting air quality.

The rationale for inclusion of chemical and nonchemical analyses: Known asbestos contamination.

Information concerning various environmental indicators: N/A

Project decision conditions ("If..., then..." statements): If visible vermiculite is observed in the soil during soil sample collection, then level D personal protective equipment (PPE) will be upgraded to half-face respirators equipped with P100 filters. If no visible vermiculite is observed in the soil, then level D PPE is appropriate. If DataRAM total particulate concentrations exceed 100 micrograms per cubic meter (or a different number determined by the field crew based on field conditions) above background for two consecutive 15-minute averages, then more effective dust suppression activities will be required during rotomilling activities until the cessation of activities. If analytical results for asbestos in air samples exceed 5.5 fibers/100 microscopic fields of view (FOV) using phase contrast microscopy (PCM) NIOSH Method 7400, then samples will be analyzed by transmission electron microscopy (TEM) ISO Methods 10312 or 13794 to verify the presence of asbestos. If analytical results for asbestos in air samples by PCM are negative, then ten percent of the air samples will be analyzed by the TEM ISO Methods listed above. The ten percent of air samples to be analyzed by TEM will be selected based on the highest readings by PCM, even though PCM results may be less than 5.5 fibers/100 FOV. All air samples will be taken to the EMSL/Libby laboratory in Libby, MT for a determination of cassette filter loading.

Revision Number: Final
Revision Date: 11/07/2011
Page 17 of 52

## QAPP Worksheet #11 Project Quality Objectives /Systematic Planning Process Statements

Who will use the data? EPA Region VIII, MDOT and MDEQ

What will the data be used for? Data will be used to evaluate the potential health risks to site workers and Libby residents who may be exposed to LA, other amphibole asbestos, and chrysotile asbestos in outdoor air during routine maintenance and constructions work in OU8.

What type of data are needed? (target analytes, analytical groups, field screening, on-site analytical or off-site laboratory techniques, sampling techniques) Particulate air monitoring data using DataRAMs; ABS, perimeter and ambient air sampling data for asbestos using NIOSH 7400, Asbestos and Other Fibers by PCM, TEM-ISO 10312, Asbestos in Ambient Air by TEM, Direct Prep, and TEM-ISO 13794, Asbestos in Ambient Air by TEM, Indirect Prep; soil sampling data for asbestos using NIOSH 9002, Asbestos (bulk) by PLM, and EPA 600/R-93/116, Method for the Determination of Asbestos in Bulk Building Materials.

How "good" do the data need to be in order to support the environmental decision? Asbestos data must meet definitive and screening data requirements according to the Libby Site. For each sample collected, samplers must fill out a sample log sheet which will be provided by CDM. DataRAM and MET data must meet the following data requirements:

1. Monitoring documentation in the form of field logbooks and appropriate field data sheets.

2. All instrument calibration and/or performance check procedures/methods will be summarized and documented in the appropriate field, personal, or instrument log notebook. Refer to the manufacturer's instructions or the appropriate Standard Operating Procure (SOP) for specific procedures and frequency for calibration during use.

3. Reporting limits (RLs) will be determined and documented along with the data, where appropriate.

All equipment used will undergo a wet decon between each sampling station.

Title: Libby OU8 SAP/QAPP Revision Number: Final Revision Date: 11/07/2011 Page 18 of 52

## QAPP Worksheet #11 Project Quality Objectives /Systematic Planning Process Statements (continued)

How much data are needed (number of samples for each analytical group, matrix, and concentration)?

Soil Samples Soil samples will be collected along both sides of selected ROWs from the following roadways in OU8: Highway 37 from Rainy Creek Road to the dam, Highway 2, Highway 260, Highway 482, and Highway 567. One soil aliquot will be collected for every 100 feet (ft) of ROW. The aliquots will be pulled from areas with visible vermiculite. A composite sample will be created out of ten aliquots; therefore, one composite sample will be created for every 1,000 ft of ROW. The volume of soil required for each aliquot should be approximately 100 grams (g) in order to make a composite sample of approximately one kilogram (kg). A total of approximately 250 composite samples will be created.

ABS Samples ABS samples will be collected from approximately six locations along the above listed highways pending the results of the soil samples. Samples will be collected using a minimum of two all-terrain vehicles (ATVs) at each location (one rider followed by at least one other rider). ATV riders will each be equipped with a low-flow (2-3 Liters/minute (L/min)) personal air sampler. Air cassettes will be changed at a set time determined on-site by the field crew. A minimum of 12 ABS air samples will be collected. MDEQ is also expected to mow areas along Highway 37. One high flow (10 L/min) and one low flow (2-3 L/min) air sampler will be set up daily on each mower during the duration of the mowing activities, and air sample cassettes will be changed every two hours or as determined on-site by the field crew. Representative soil samples will also be collected from each mowing area prior to the start of mowing activities. The exact number of air and soil samples collected during mowing activities will be determined on-site by the field crew.

Rotomilling Samples Four DataRAMs for real-time particulate monitoring will be set up each day of rotomilling activities. MET data will be collected at the start of each work day, or more frequently if necessary. A minimum of ten perimeter air samplers (five high flow (10 L/min) and five low flow (2-3 L/min)) will be set up daily, which includes one high flow and one low flow sampler on the rotomilling equipment. Perimeter air sample cassettes will be changed every two hours or as determined on-site by the field crew. Therefore, approximately 40 perimeter air samples will be collected per day of rotomilling activities. Additionally, a minimum of eight to ten ambient air samplers will be set up each day during the duration of the MDOT rotomilling and asphalt project. All ambient air samplers will be set at a high flow rate (10 L/min) for an 8 to 12-hour period. Therefore, one ambient air sample per day will be collected at each sampler station for a minimum total of eight samples collected per day.

Where, when, and how should the data be collected/generated? DataRAMs will be used according to the manufacturer's instructions. MET data will be collected according to SERAS SOP #2129, Met One Remote Meteorological Station. Perimeter and ambient air samples will be collected daily according to SERAS SOP #2015, Field Sampling for Air Asbestos. Locations of the perimeter and ambient air samples will be determined in the field on the day of the sample collection, and will be based on MET data and traffic patterns. The locations of soil aliquot samples along the highway ROWs will be determined based on the results of the soil samples and collected according to SERAS SOP #2015, Field Sampling for Air Asbestos..

Who will collect and generate the data? ERT/SERAS will collect and generate all field data (DataRAM and MET data; soil samples; and ABS, perimeter and ambient air samples). ESAT, or a subcontract laboratory determined by ESAT, will generate all analytical data.

Title: Libby OU8 SAP/QAPP Revision Number: Final Revision Date: 11/07/2011 Page 19 of 52

## QAPP Worksheet #11 Project Quality Objectives /Systematic Planning Process Statements (continued)

How will the data be reported? Real-time DataRAM and MET data will be posted daily to a secure internet site and uploaded into the Scribe database by ERT/SERAS. Asbestos analytical data (soil and air) will be reported by the analytical laboratory in the form of an electronic data deliverable (EDD) and a pdf of the Data Report via email. All asbestos analytical data is uploaded into the Scribe database by the ESAT Data Manager.

How will the data be archived? Hard copies of all monitoring data and analytical data will be given to the EPA PO, or his/her designate. Electronic copies of all monitoring data and analytical data will be archived in the Scribe database. Electronic copies of all analytical data will be archived on the ESAT network drive and backed up nightly on an external hard drive by the ESAT Data Manager.

Page 25 of 52

### QAPP Worksheet #14 Summary of Project Tasks

Sampling Tasks:

Soil Samples Soil samples will be collected along both sides of selected ROWs from the following roadways in OU8: Highway 37 from Rainy Creek Road to the dam, Highway 2, Highway 260, Highway 482, and Highway 567. One soil aliquot will be collected for every 100 ft of ROW. A person trained to visually detect vermiculite in soil in the field will mark areas where vermiculite is detected using spray paint, flags, or other markers. The aliquots will be pulled from these areas marked for visible vermiculite. A composite sample will be created out of ten aliquots; therefore, one composite sample will be created for every 1,000 ft of ROW. The volume of soil required for each aliquot should be approximately 100 g in order to make a composite sample of approximately one kg. Multiple field crews may be deployed to collect soil samples in order ensure soil samples are submitted for processing and analysis as quickly as possible and results are received prior to the start of AMS sampling. All soil samples will be collected in 4-mil poly bags. A total of approximately 250 composite samples will be created.

ABS samples ABS samples will be collected from approximately six locations along the above listed highways pending the results of the soil samples. Samples will be collected using a minimum of two ATVs at each location (one rider followed by at least one other rider). ATV riders will each be equipped with a low-flow (2-3 L/min) personal air sampler. Air cassettes will be changed at a set time determined on-site by the field crew. A minimum of 12 ABS air samples will be collected. MDEQ is also expected to mow areas along Highway 37. One high flow (10 L/min) and one low flow (2-3 L/min) air sampler will be set up daily on each mower during the duration of the mowing activities, and air sample cassettes will be changed every two hours or as determined on-site by the field crew. Representative soil samples will also be collected from each mowing area prior to the start of mowing activities. The exact number of air and soil samples collected during mowing activities will be determined on-site by the field crew.

Rotomilling Samples Ambient air sampling stations will remain in place at locations away from the immediate rotomilling activities and used daily until all sidewalks and roads are resurfaced. Each ambient air sample will be collected over an 8 to 12-hour period at a set high flow rate of 10 L/min using mixed cellulose ester (MCE) filter cassettes for a total volume of between 4,800 and 6,000 L. Perimeter air samples will be collected along the perimeter of the rotomilling activity, at both upwind and downwind locations. These locations will be determined and adjusted daily depending on wind direction and other weather-related events, traffic patterns, and the duration of each rotomilling activity. ABS samples will also be collected directly from the rotomilling equipment. At each determined perimeter air sample location, including the rotomilling equipment, samplers will be set up for both high flow and low flow rates, and the cassettes will be changed every two hours, or at a set time determined on-site by the field crew. Low flow samples will be collected at a set flow rate of 2-3 L/min using MCE filter cassettes for an approximate total volume of 240 to 360 L. High flow samples will be collected at a set flow rate of 10L/min using MCE filter cassettes for an approximate total volume of 1,200 L. All perimeter air samples will be collected at breathing height, approximately four to five feet above the ground surface. A minimum of eight ambient air samples and 40 perimeter air samples will be collected each day for the duration of the rotomilling project.

Note that ERT/SERAS is responsible for supplying all field sampling equipment, ATVs, and appropriate PPE. All sample locations must be recorded on-site using a GPS unit.

Title: Libby OU8 SAP/QAPP Revision Number: Final Revision Date: 11/07/2011 Page 26 of 52

### QAPP Worksheet #14 Summary of Project Tasks (continued)

Analysis Tasks: EMSL/Libby, an on-site laboratory subcontracted by ESAT, will be used for rapid-turn analysis of all soil samples by PLM NIOSH Method 9002, and all ABS and perimeter air samples by PCM NIOSH Method 7400. EMSL, or another ESAT-designated laboratory, will be used for the analysis of all other air samples by PCM NIOSH Method 7400. ESAT, EMSL, or another ESAT-designated laboratory, will be used for the analysis of air samples by TEM ISO Methods 10312 or 13794. All air samples will be taken to the on-site EMSL laboratory initially to determine particulate loading of the MCE filter cassettes. The flow rates of the air samplers may be adjusted by the field crew based on this initial filter inspection by EMSL. ESAT, EMSL, or another ESAT-designated laboratory may also be used for the analysis of soil samples by EPA Method 600/R-93/116, as requested by the EPA PO.

Quality Control Tasks: Field duplicate soil samples will be collected at a rate of one duplicate sample per 20 soil samples collected. Soil sample field blanks will be collected at a rate of one field blank sample per 20 soil samples collected. Blank sand to be used as field blank sample material will be provided by the soil prep facility in Troy, Montana. One lot blank will be analyzed for each new lot of MCE filter cassettes. One field blank will be collected and submitted for analysis for each day of sampling for the duration of the ABS and rotomilling activities. Four perimeter field duplicates will be collected and analyzed for each day of sampling (two collected at the high flow rate and two at the low flow rate; perimeter field duplicates will be collected in the same manner as the high or low flow rate samples collected during the rotomilling activities). One ambient air field duplicate will be collected over an 8-hour period at the high flow rate and analyzed each day for the duration of the rotomilling project.

Secondary Data: N/A

Data Management Tasks: All sampling location identification (ID) numbers will be given to ERT by ESAT prior to the sampling event. Field sampling data will be recorded for each sample collected by ERT personnel on a sample log sheet (provided by CDM) and loaded into the Scribe database. All samples and copies of sample log sheets will be delivered to the EMSL/Libby laboratory. ERT/SERAS is responsible for generating all chain of custody (COC) forms prior to delivery of the samples to the laboratory. Deliverables will be generated according to appropriate SERAS, ESAT or EMSL SOPs. Modes of delivery include electronic delivery of all related documents and data upload into the Scribe Database.

Documentation and Records: All documentation will be recorded in accordance with all the Project SOPs listed in Worksheet #21

Assessment/Audit Tasks: No performance audit of field operations is anticipated for this project. The tasks associated with this SAP/QAPP are assessed using peer reviews and management system reviews. Peer review enables the field team to identify and correct recording errors before sample log sheets are submitted. Peer review enables the analytical team to identify and correct reporting errors before Data Reports are delivered. Management system reviews establish compliance with prevailing management structure, policies and procedures, and ensures that the required data are obtained.

Data Review Tasks: Analytical data will be validated in accordance with EDD requirements. All project deliverables will receive an internal peer review prior to release, per guidelines established in the SERAS and/or ESAT Quality Management Plan (QMP), or related document.

### QAPP Worksheet #17 Sampling Design and Rationale

Describe and provide a rationale for choosing the sampling approach (e.g., grid system, biased statistical approach): Soil and ABS samples will be collected along both sides of selected ROWs from the following roadways in OU8: Highway 37 from Rainy Creek Road to the dam, Highway 2, Highway 260, Highway 482, and Highway 567. All sample locations will be judgmental based on visual inspection of the area for vermiculite and the specific schedule of lawn mowing activities along Highway 37. Soil samples will be collected to determine the best locations of the ABS samples. ABS samples will be collected to determine if airborne dust generated from routine maintenance activities is contaminated with LA, other amphibole asbestos, or chrysotile asbestos, and therefore, posing an exposure risk to persons performing the maintenance work and the residents of Libby. Attachment A identifies the five highway segments located in OU8.

The MDOT rotomilling and asphalt work will take place on Highway 37 between Highway 2 and the bridge over the Kootenai River in Libby. All sample locations will be judgmental based on daily rotomilling activities, visual inspection of the work area, and MET data. Perimeter and ABS samples will be collected to determine if airborne dust generated from the rotomilling activities is contaminated with LA, other amphibole asbestos, or chrysotile asbestos, and therefore, posing an exposure risk to persons performing the rotomilling work and the residents of Libby. Ambient air samples will be collected to determine the concentration of asbestos in ambient air during the rotomilling project. Ambient air samplers will be placed in areas that are open or on top of buildings with rooflines above surrounding buildings, and where access to the properties is likely to be granted. Ambient air sampler locations will spatially cover the section of Highway 37 where rotomilling work will be performed. Eight ambient air samplers will be set up along Highway 37 between Highway 2 and bridge over the Kootenai River, and two ambient air samplers will be set up at locations across the river. Attachment B identifies properties along Highway 37 where it is likely that ambient air samplers can be set up anywhere on the property.

## QAPP Worksheet #17 Sampling Design and Rationale (continued)

Describe the sampling design and rationale in terms of what matrices will be sampled, what analytical groups will be analyzed and at what concentration levels, the sampling locations (including QC, critical, and background samples), the number of samples to be taken, and the sampling frequency (including seasonal considerations) [May refer to map or Worksheet #18 for details]: One soil aliquot will be collected for every 100 ft of ROW along the five highway segments. The aliquots will be pulled from areas marked for visible vermiculite. A composite sample will be created out of ten aliquots; therefore, one composite sample will be created for every 1,000 ft of ROW. The volume of soil required for each aliquot should be approximately 100 g in order to make a composite sample of approximately one kg. A total of approximately 250 composite samples will be created.

ABS samples will be collected from approximately six locations along the highways pending the results of the soil samples. Samples will be collected using ATVs at each location. ATV riders will be equipped with low-flow personal air samplers with cassettes that will be changed at a set time determined on-site by the field crew. A minimum of 12 ABS air samples will be collected. MDEQ is also expected to mow areas along Highway 37. One high flow and one low flow air sampler will be set up daily on each mower during the duration of the mowing activities, and air sample cassettes will be changed every two hours or as determined on-site by the field crew. Representative soil samples will also be collected from each mowing area prior to the start of mowing activities. The exact number of air and soil samples collected during mowing activities will be determined on-site by the field crew. Field duplicate soil samples will be collected at a rate of one duplicate sample per 20 soil samples collected. Soil sample field blanks will be collected at a rate of one field blank sample per 20 soil samples collected. Blank sand to be used as field blank sample material will be provided by the soil prep facility in Troy, Montana.

A minimum of ten perimeter air samplers (five high flow and five low flow) will be set up daily, which includes one high flow and one low flow sampler on the rotomilling equipment. Perimeter air sample cassettes will be changed every two hours or as determined on-site by the field crew. Therefore, approximately 40 perimeter air samples will be collected per day of rotomilling activities. A minimum of eight to ten ambient air samplers will be set up each day during the duration of the rotomilling project. All ambient air samplers will be set at a high flow rate for an 8 to 12-hour period. Therefore, one ambient air sample per day will be collected at each sampler station for a minimum total of eight samples collected per day. Four perimeter field duplicates will be collected and analyzed for each day of sampling (two collected at the high flow rate and two at the low flow rate; perimeter field duplicates will be collected in the same manner as the high or low flow rate samples collected during the rotomilling activities). One ambient air field duplicate will be collected over an 8-hour period at the high flow rate and analyzed each day for the duration of the rotomilling project. One lot blank will be analyzed for each new lot of MCE filter cassettes. One field blank will be collected and submitted for analysis for each day of sampling for the duration of the ABS and rotomilling activities.

# QAPP Worksheet #25 Analytical Instrument and Equipment Maintenance, Testing, and Inspection Table

X Worksheet Not Applicable: Responsibility lies within the contracted laboratory.

| Instrument/ | Maintenance | Testing  | Inspection     | Frequency | Acceptance | Corrective | Responsible | SOP                    |
|-------------|-------------|----------|----------------|-----------|------------|------------|-------------|------------------------|
| Equipment   | Activity    | Activity | Activity       |           | Criteria   | Action     | Person      | Reference <sup>1</sup> |
|             |             |          | Car management |           | - 41       |            |             |                        |

TSpecify the appropriate reference letter or number from Analytical SOP References table (Worksheet #23).

Title: Libby OU8 SAP/QAPP Revision Number: Final Revision Date: 11/07/2011 Page 41 of 52

#### QAPP Worksheet #26 Sample Handling System

#### SAMPLE COLLECTION, PACKAGING, AND SHIPMENT

Sample Collection (Personnel/Organization): ERT/SERAS Field personnel

Sample Packaging (Personnel/Organization): Sample Coordinator/ESAT

Coordination of Shipment (Personnel/Organization): Sample Coordinator/ESAT

Type of Shipment/Carrier: Personal delivery to EMSL/Libby laboratory or FedEx to ESAT

#### SAMPLE RECEIPT AND ANALYSIS

Sample Receipt (Personnel/Organization): Laboratory Analyst/ESAT or subcontract laboratory determined by ESAT

Sample Custody and Storage (Personnel/Organization): Laboratory Analyst/ESAT or subcontract laboratory determined by ESAT

Sample Preparation (Personnel/Organization): Laboratory Analyst/ESAT or subcontract laboratory determined by ESAT

Sample Determinative Analysis (Personnel/Organization): Laboratory Analyst/ESAT or subcontract laboratory determined by ESAT

#### SAMPLE ARCHIVING

Field Sample Storage (No. of days from sample collection): Samples shipped to archive facility in Libby, MT

Sample Extract/Digestate Storage (No. of days from extraction/digestion): N/A

Biological Sample Storage (No. of days from sample collection): N/A

#### SAMPLE DISPOSAL

Personnel/Organization: Samples will not be disposed of

Number of Days from Analysis: N/A

Title: Libby OU8 SAP/QAPP Revision Number: Final Revision Date: 11/07/2011 Page 42 of 52

#### QAPP Worksheet #27 Sample Custody Requirements

Field Sample Custody Procedures (sample collection, packaging, shipment, and delivery to laboratory): ERT/SERAS field personnel will be responsible for sample collection and delivery to the EMSL/Libby laboratory for initial sample inspection of air cassette filter loading and analysis. ERT/SERAS will be responsible for generating COC forms. The ESAT Sample Coordinator will be responsible for sample packaging and shipment to ESAT as necessary.

Laboratory Sample Custody Procedures (receipt of samples, archiving, disposal): EMSL/Libby and ESAT personnel will be responsible for sample receipt. ESAT will be responsible for sample archival. Samples will not be disposed of.

Sample Identification Procedures: The ESAT Data Manager will provide ERT/SERAS with a unique sample ID number for each sample. The sample ID numbers will be recorded on the COC forms by field personnel, and the samples, along with the original COC forms, will be relinquished to the analytical laboratory (or the sample prep facility in Troy, MT at the request of the EPA PO). Once the samples arrive at the analytical laboratory, the laboratory will assign samples associated with each COC form to a unique work order number. Samples associated with each work order number will then be assigned a unique laboratory sample ID number.

Chain of custody Procedures: SERAS SOP #4005
